

AMENDMENT(S) TO THE SPECIFICATION:

Kindly amend paragraph number [0070] as follows:

--[0070] Note that the search for a valid URL from an accepted URL is carried out part-by-part. ~~As~~ As an example, the domain name part of the URL is searched for a valid domain name. Then once the domain name is resolved, the “file” part of the URL is searched for from a much more limited set ~~of files~~ of files—those that are valid on the server (domain name or IP address) specified by the domain name part of the URL. Alternatively, in one implementation, one perform a parallel search for a valid URL using simultaneously multiple searches for individual parts (substrings) of the URL. The resulting set of close matches to the URL is obtained by merging individual sets for substrings. This implementation can take advantage of simultaneous multiprocessing computations/searches.
